The screenshot shows the KAYAK website interface for flight searches. The search parameters are London, United Kingdom to Boston, MA, United States, from 06/03/2013 to 13/03/2013. The results show 55 of 1327 flights, sorted by Price - Low to High. The first flight is Delta for £420, and the second is Virgin Atlantic for £445. The interface includes a 'Check Fares' section with a promotional message: 'Up to 10% off flights to and 15% off hotels in Boston'. There are also sections for 'Price Trend', 'Stops', 'Times', and 'Airports'.

The screenshot shows the VAO Data Discovery Tool interface. The search query is 'ngc1333' with a radius of 1. The results table lists various astronomical data sources and their titles. The table has columns for 'Type', 'Short Name', and 'Title'. The results include:

Tutorial for embedding 3D interactive graphics into PDF

by *Guest* on March 7, 2012

Josh Peek (@joshuaegpeek) is a Hubble Fellow at Columbia University, specializing in the ISM in and around disk galaxies. He has a fascination with data presentation and design.

As an astronomer studying the complex three-dimensional structures of the interstellar medium, I've been taken with the idea of presenting that information in a compelling and interactive way to readers. The major mode of communication for astronomers is the refereed journal article, as distributed through PDF, so I got interested in how one can package interactive 3D scenes with the papers we write. Interactive graphics can be embedded in PDFs that can be rotated, panned, and zoomed.

THE “NESSIE” NEBULA: CLUSTER FORMATION IN A FILAMENTARY INFRARED DARK CLOUD

Received 2010 April 13; accepted 2010 July 21; published 2010 August 3

ABSTRACT

The “Nessie” Nebula is a filamentary infrared dark cloud (IRDC) with a large aspect ratio of over 150:1 ($1^{\circ}5 \times 0^{\circ}01$ or $80 \text{ pc} \times 0.5 \text{ pc}$ at a kinematic distance of 3.1 kpc). Maps of HNC (1–0) emission, a tracer of dense molecular gas, made with the Australia Telescope National Facility Mopra telescope, show an excellent morphological match to the mid-IR extinction. Moreover, because the molecular line emission from the entire nebula has the same radial velocity to within $\pm 3.4 \text{ km s}^{-1}$, the nebula is a single, coherent cloud and not the chance alignment of multiple unrelated clouds along the line of sight. The Nessie Nebula contains a number of compact, dense molecular cores which have a characteristic projected spacing of $\sim 4.5 \text{ pc}$ along the filament. The theory of gravitationally bound gaseous cylinders predicts the existence of such cores, which, due to the “sausage” or “varicose” fluid instability, fragment from the cylinder at a characteristic length scale. If turbulent pressure dominates over thermal pressure in Nessie, then the observed core spacing matches theoretical predictions. We speculate that the formation of high-mass stars and massive star clusters arises from the fragmentation of filamentary IRDCs caused by the “sausage” fluid instability that leads to the formation of massive, dense molecular cores. The filamentary molecular gas clouds often found near high-mass star-forming regions (e.g., Orion, NGC 6334, etc.) may represent a later stage of IRDC evolution.

Key words: ISM: clouds – stars: formation

Why $b < 0$?! Galactic Geometry: 1959 and Now

Drawing is schematic--NOT to scale

The equatorial plane of the new co-ordinate system must of necessity pass through the sun. It is a fortunate circumstance that, within the observational uncertainty, both the sun and Sagittarius A lie in the mean plane of the Galaxy as determined from the hydrogen observations. If the sun had not been so placed, points in the mean plane would not lie on the galactic equator.

The screenshot shows the Authorea interface for a 'WORKING DRAFT' article titled 'The Bones of the Milky Way'. The article is by Alyssa Goodman, Joao Alves, Chris Beaumont, Tom Dame, James Jackson, Jens Kauffmann, Thomas Robitaille, Alberto Pepe, Michelle Borkin, and Andreas Burkert. The abstract discusses the discovery of a highly elongated bone-like feature within the Scutum-Centaurus spiral arm, tracing out a highly elongated bone-like feature within the prominent Scutum-Centaurus spiral arm. The article is last updated about 1 month ago by Alberto Pepe.
